Native and Mass-Labelled **Mono- and Di-Substituted Polyfluorinated Phosphate Esters (PAPs & diPAPs)**

The application of polyfluorinated phosphate esters (PAPs) to food-contact paper products has raised concerns regarding our potential exposure levels. It has been shown that PAPs can leach out of food packaging and into the food that we consume. PAPs can be mono-, di-, or tri-substituted (monoPAPs, diPAPs, or triPAPs respectively) and the polyfluorinated alkyl chain can vary in length with the most commonly observed homologues being the 6:2 and 8:2 chain lengths. The toxicities associated with these compounds, and the fact that they have been identified as possible precursors to perfluoroalkylcarboxylic acids during biotransformation, have made the development of methods for the accurate analysis of these compounds necessary.

In response to customer requests, Wellington has produced both native and mass-labelled (^{13}C) reference standards for the 6:2 and 8:2 monoPAPs and diPAPs.
